## Common Architecture of a Knowledge-based System

## Knowledge Representation Formalisms. A Summary

- **Knowledge representation**

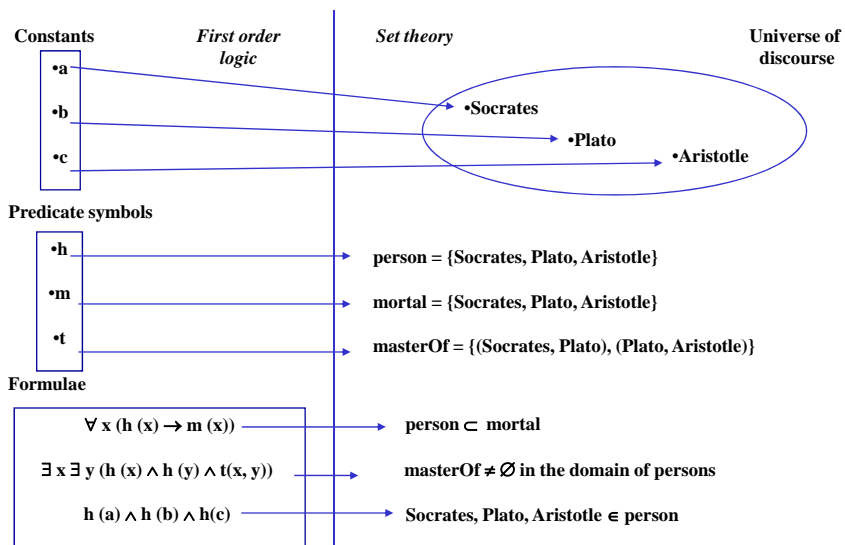

- To store knowledge so that programs can process it and achieve the verisimilitude of human intelligence

- **Knowledge representation formalisms/techniques**

- Originated from theories of human information processing.
  - Since knowledge is used to achieve intelligent behavior, the fundamental goal of knowledge representation is to represent knowledge in a manner as to facilitate inferencing i.e. drawing conclusions from knowledge.
  - Some examples are:
    - First order logic
    - Semantic networks and conceptual maps
    - Frames
    - Description logic
    - Production rules
    - Fuzzy logic
    - Bayesian networks
    - Etc.
- } These are the ones that we will analyse

## First order logic. Basic elements

We can establish mappings between logical symbols and domain objects (universe of discourse)

## First order logic. Formalisation

- **Se tiene un robot que distribuye paquetes en oficinas. Se sabe que:**
  - Los paquetes de la habitación 27 son más pequeños que los de la habitación 28.
  - Todos los paquetes de la misma habitación son del mismo tamaño.
  - En un instante concreto el robot sabe que:
    - i) El paquete A está en la habitación 27 ó 28 (pero no sabe en cuál).
    - ii) El paquete B está en la habitación 27.
    - iii) El paquete B no es más pequeño que el A.
  - El robot quiere probar que el paquete A está en la habitación 27.

## First order logic. Formalisation. Solution

- **Se tiene un robot que distribuye paquetes en oficinas. Se sabe que:**
  - Los paquetes de la habitación 27 son más pequeños que los de la habitación 28.  
 $\forall x \forall y (\text{paquete}(x) \wedge \text{situadoEn}(x, h27) \wedge \text{paquete}(y) \wedge \text{situadoEn}(y, h28) \rightarrow \text{menor}(x, y))$
  - Todos los paquetes de la misma habitación son del mismo tamaño.  
 $\forall x \forall y \forall h (\text{paquete}(x) \wedge \text{paquete}(y) \wedge \text{habitacion}(h) \wedge \text{situadoEn}(x, h) \wedge \text{situadoEn}(y, h) \rightarrow \text{igual}(x, y))$
  - En un instante concreto el robot sabe que:
    - i) El paquete A está en la habitación 27 ó 28 (pero no sabe en cuál).  
 $\text{paquete}(a) \wedge \text{habitacion}(h27) \wedge \text{habitacion}(h28) \wedge (\text{situadoEn}(a, h27) \vee \text{situadoEn}(a, h28))$
    - ii) El paquete B está en la habitación 27.  
 $\text{paquete}(b) \wedge \text{situadoEn}(b, h27)$
    - iii) El paquete B no es más pequeño que el A.  
 $\neg \text{menor}(b, a)$
  - El robot quiere probar que el paquete A está en la habitación 27.  
 $\text{¿situadoEn}(a, h27)?$

## Semantic Network. Basic elements

- **Nodes**

- They represent entities or concepts, or values

- **Edges**

- They represent properties or relations

- **The semantics (mapping to the real world) depends on the tags used for nodes and edges**

- **There is no predefined KR vocabulary**

- Although sometimes there are *structural* edges

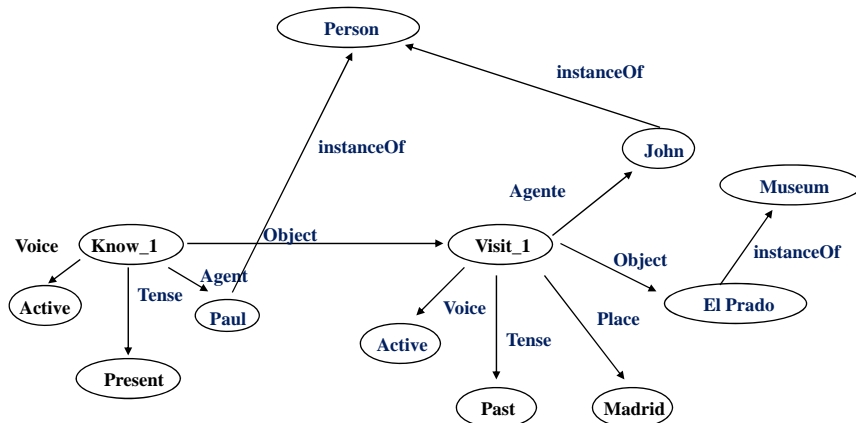

## Semantic networks. Example

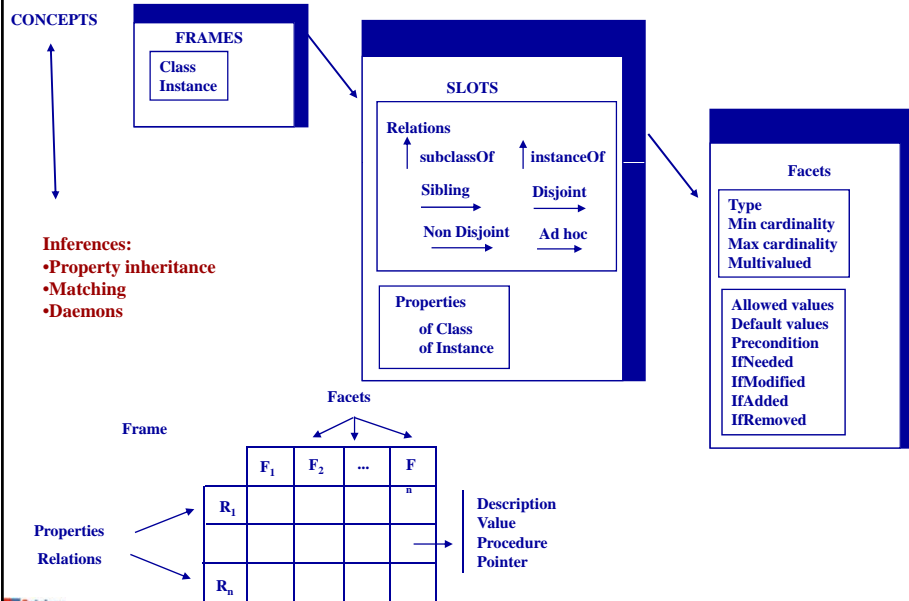

- **Paul and John are persons**
- **El Prado is a museum**
- **Paul knows that John visited El Prado in Madrid**

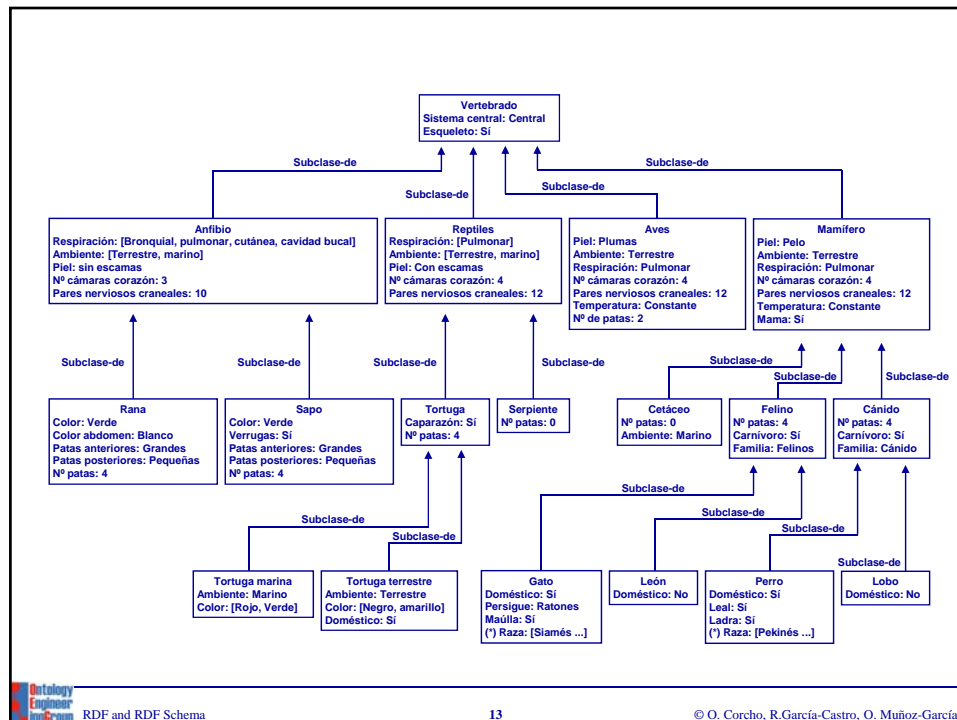

## Semantic networks. Example. Solution

- Paul and John are persons
- El Prado is a museum
- Paul knows that John visited El Prado in Madrid

## Frames. Basic elements

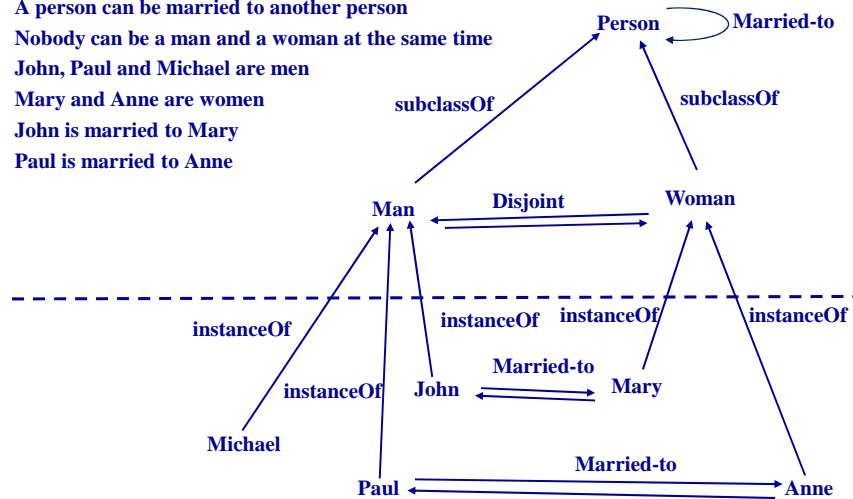

## Frames. Example

- Men and women are persons
- A person can be married to another person
- Nobody can be a man and a woman at the same time
- John, Paul and Michael are men
- Mary and Anne are women
- John is married to Mary
- Paul is married to Anne

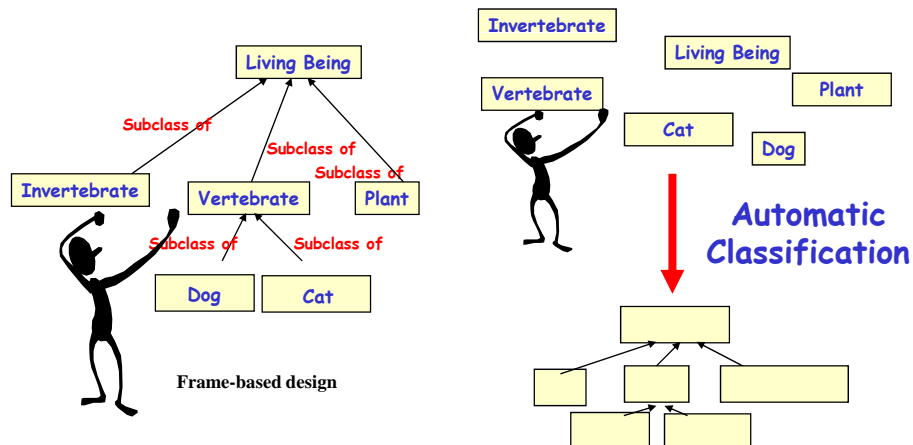

## Frames. Example

- Men and women are persons
- A person can be married to another person
- Nobody can be a man and a woman at the same time
- John, Paul and Michael are men
- Mary and Anne are women
- John is married to Mary
- Paul is married to Anne

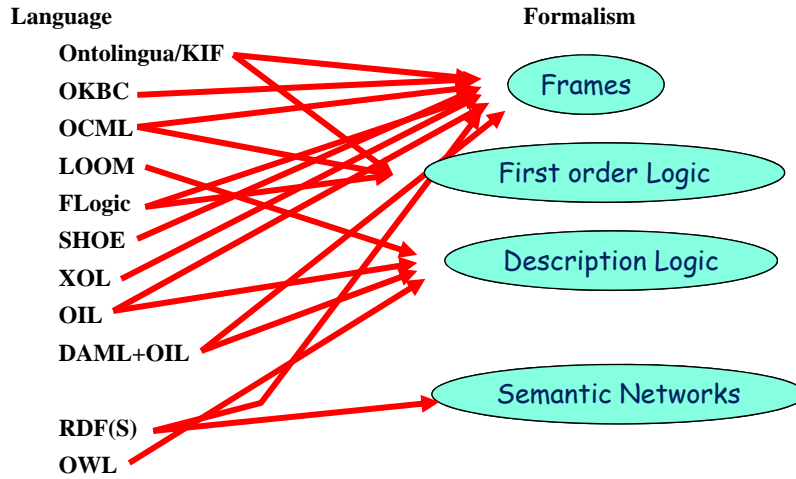

## Description Logics. Basic elements

- A subset of first order logic with good reasoning properties
- **Automatic classification**

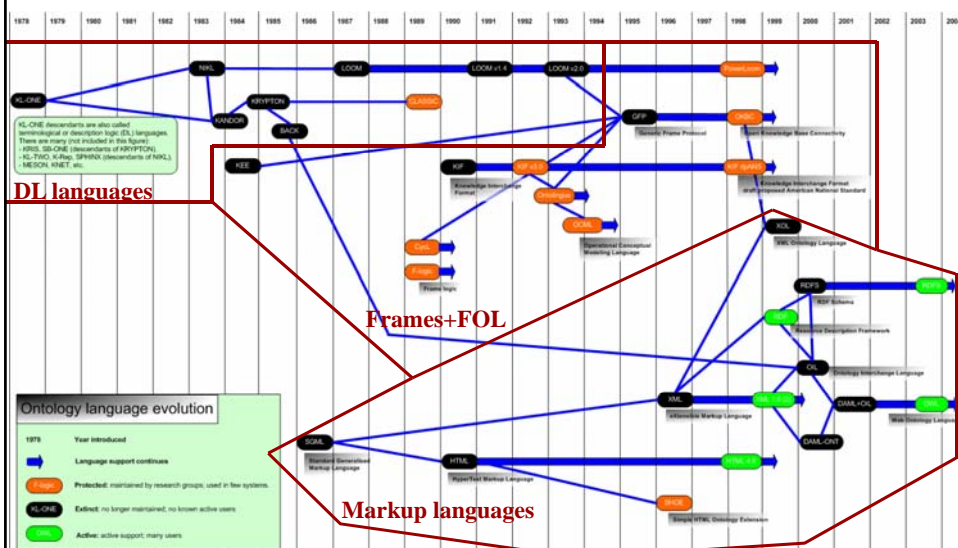

## KR Formalisms

## Ontology language evolution

## Ontology Languages (I)

### Traditional ontology languages

## Table of Contents

1. An introduction to knowledge representation formalisms
2. **Resource Description Framework (RDF)**
  - 2.1. RDF primitives
  - 2.2. Reasoning with RDF
3. RDF Schema
  - 3.1 RDF Schema primitives
  - 3.2 Reasoning with RDFS
4. RDF(S) management APIs
5. RDF(S) query languages: SPARQL

## RDF: Resource Description Framework

- W3C recommendation
- **RDF is a basic KR language, based on semantic networks**
  - Useful to represent metadata and describe any type of information in a machine-accessible way (aka data model)
  - Resources are described in terms of properties and property values using RDF statements.
  - Statements are represented as triples, consisting of a subject, predicate and object. [S, P, O]

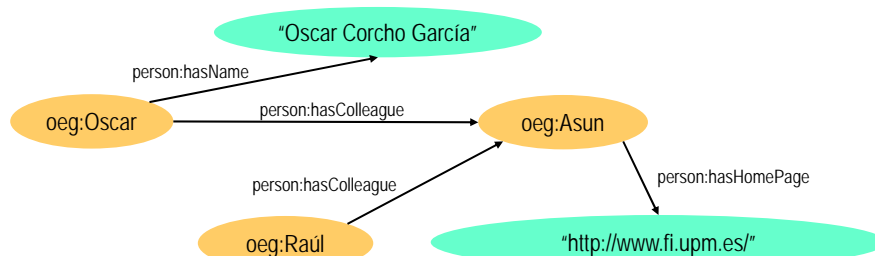

## RDF (and other W3C Recommendations) and URIs

- A URI (Unique Resource Identifiers) is a Web identifier
  - e.g. <http://www.oeg-upm.net/ontologies/people#Oscar>
  - URI  $\neq$  URL
    - If we open a Web browser and point to that URI, the corresponding object will not be downloaded or shown
    - If URLs work for **locating** uniquely (with no collisions) a Web page/resource, why not using the same approach for **identifying** Web resources?
  - Other valid URIs could be
    - <ftp://www.oeg-upm.net/ontologies/people#Oscar>
    - <persons://www.oeg-upm.net/ontologies/people#Oscar>
    - ...
- URIs allow identifying
  - Individuals: <http://www.oeg-upm.net/ontologies/people#Oscar>
  - Kinds of things: <http://www.ontologies.org/ontologies/people#Person>
  - Properties of those things: <http://www.ontologies.org/ontologies/people#hasColleague>

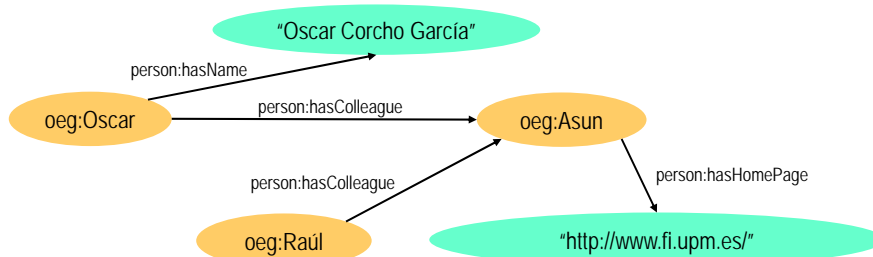

## RDF (and other W3C Recommendations) and URIs

- For practical purposes, especially if handwritten, URIs are shortened using XML namespaces
  - `xmlns:oeg="http://www.oeg-upm.net/ontologies/people#"`
  - `oeg:Oscar` is equivalent to `http://www.oeg-upm.net/ontologies/people#Oscar`

## RDF (and other W3C Recommendations) and URIs

- A set of URIs is sometimes known as a vocabulary
  - The RDF Vocabulary
    - The set of URIs used to describe the RDF concepts: **rdf:Property**, **rdf:Resource**, **rdf:type**, etc.
  - The RDFS Vocabulary
    - The set of URIs used in describing RDF Schema: **rdfs:Class**, **rdfs:domain**, etc.
  - The 'Person' Vocabulary
    - **person:hasColleague**, **person:Person**, **person:Employee**, etc.

## RDF Serialisations

- **Normative**
  - RDF/XML ([www.w3.org/TR/rdf-syntax-grammar/](http://www.w3.org/TR/rdf-syntax-grammar/))
- **Alternative (for human consumption)**
  - N3 (<http://www.w3.org/DesignIssues/Notation3.html>)
  - Turtle (<http://www.dajobe.org/2004/01/turtle/>)
  - TriX (<http://www.w3.org/2004/03/trix/>)
  - ...

**Important note:** the order of RDF statements in a serialisation does not affect the behaviour of a parser/application

## RDF Serialisations. RDF/XML

```
<?xml version="1.0"?>
<rdf:RDF
  xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xmlns:person="http://www.ontologies.org/ontologies/people#"
  xmlns="http://www.oeg-upm.net/ontologies/people#"
  xml:base="http://www.oeg-upm.net/ontologies/people">

  <rdf:Property rdf:about="http://www.ontologies.org/ontologies/people#hasHomePage"/>
  <rdf:Property rdf:about="http://www.ontologies.org/ontologies/people#hasColleague"/>
  <rdf:Property rdf:about="http://www.ontologies.org/ontologies/people#hasName"/>

  <rdf:Description rdf:about="#Raúl"/>
  <rdf:Description rdf:about="#Asun">
    <person:hasColleague rdf:resource="#Raúl"/>
    <person:hasHomePage>http://www.fi.upm.es</person:hasHomePage>
  </rdf:Description>
  <rdf:Description rdf:about="#Oscar">
    <person:hasColleague rdf:resource="#Asun"/>
    <person:hasName>Oscar Corcho García</person:hasName>
  </rdf:Description>

</rdf:RDF>
```

## RDF Serialisations. N3

```
@base <http://www.oeg-upm.net/ontologies/people >
@prefix person: <http://www.ontologies.org/ontologies/people#>
:Asun  person:hasColleague :Raúl ;
       person:hasHomePage "http://www.fi.upm.es".
:Oscar person:hasColleague :Asun ;
       person:hasName "Oscar Corcho García".
```

## Exercise

- **Objective**

- Get used to the different syntaxes of RDF

- **Tasks**

- Take the text of an RDF file and create its corresponding graph
- Take an RDF graph and create its corresponding RDF/XML and N3 files

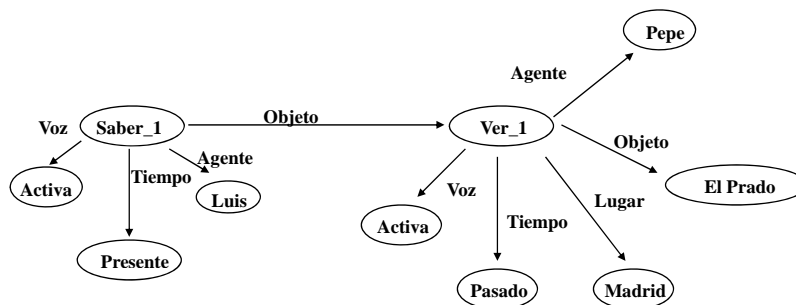

### Exercise 1.a. Create a graph from a text file

- Open the file StickyNote\_PureRDF.rdf
- Create the corresponding graph from it
- Compare your graph with those of your colleagues

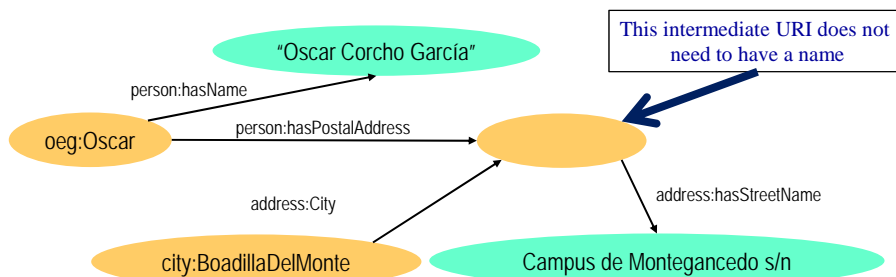

## Exercise 1.b. Create RDF/XML and N3 text files from an RDF graph

- Transform the following graph into RDF/XML and N3 syntaxes

## Blank nodes: structured property values

- Most real-world data involves structures that are more complicated than sets of RDF triple statements

- In RDF/XML, it is an `<rdf:Description>` node with no `rdf:about`
- In N3, it is an `_:oscarAddress`

## Typed literals

- So far, all values have been presented as strings
- XML Schema datatypes can be used to specify values (objects in some RDF triple statements)

- In RDF/XML, this is expressed as:
  - `<rdf:Description rdf:about="#Oscar">`  
  `<person:hasBirthDate`  
    `rdf:datatype="http://www.w3.org/2001/XMLSchema#date">02/02/1976`  
  `</person:hasBirthDate>`  
 `</rdf:Description>`
- In N3, this is expressed as:
  - `oeg:Oscar person:hasBirthDate "02/02/1976"^^xsd:date .`

## RDF Containers

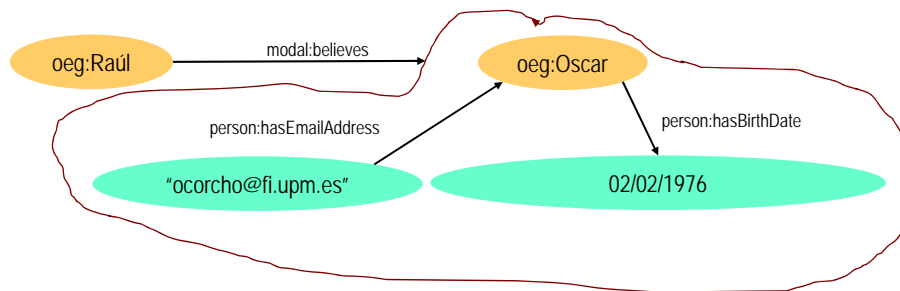

- There is often the need to describe groups of things
  - A book was created by several authors
  - A lesson is taught by several persons
  - etc.
- RDF provides a container vocabulary
  - `rdf:Bag` → A group of resources or literals, possibly including duplicate members, where the order of members is not significant.
  - `rdf:Seq` → A group of resources or literals, possibly including duplicate members, where the order of members is significant.
  - `rdf:Alt` → A group of resources or literals that are alternatives (typically for a single value of a property).

## RDF Reification

- **RDF statements about other RDF statements**

- “Raúl believes that Oscar’s birthdate is on Feb 2nd, 1976 and that his e-mail address is ocorcho@fi.upm.es”

- **RDF Reification**

- Allows expressing beliefs (and other modalities)
- Allows expressing trust models, digital signatures, etc.
- Allows expressing metadata about metadata

## Main value of a structured value (scarcely used)

- **Sometimes one of the values of a structured value is the main one**

- The weight of an item is 2.4 kilograms.
- The most important value is 2.4, which is expressed with `rdf:value`

## Table of Contents

1. An introduction to knowledge representation formalisms
2. **Resource Description Framework (RDF)**
  - 2.1. RDF primitives
  - 2.2. Reasoning with RDF
3. RDF Schema
  - 3.1 RDF Schema primitives
  - 3.2 Reasoning with RDFS
4. RDF(S) management APIs
5. RDF(S) query languages: SPARQL

## RDF inference. Graph matching techniques

- **RDF inference is based on graph matching techniques**
- **Basically, the RDF inference process consists of the following steps:**
  - Transform an RDF query into a template graph that has to be matched against the RDF graph
    - It contains constant and variable nodes, and constant and variable edges between nodes.
  - Match against the RDF graph, taking into account constant nodes and edges.
  - Provide a solution for variable nodes and edges.

## RDF inference. Examples (I)

- **Sample RDF graph**

- **Query: "Tell me who are the persons who have Asun as a colleague"**

– Result: oeg:Oscar and oeg:Raúl

## RDF inference. Examples (II)

- **Query: "Tell me which are the relationships between Oscar and Asun"**

– Result: oeg:hasColleague

- **Query: "Tell me the homepage of Oscar colleagues"**

– Result: "http://www.fi.upm.es/"

## RDF inference. Entailment rules

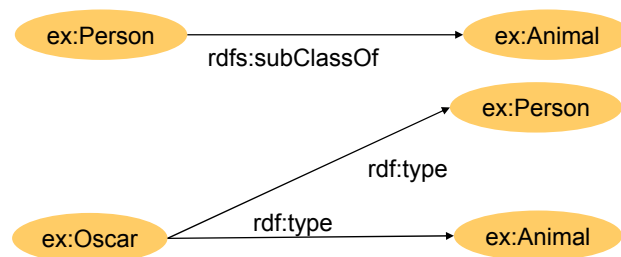

Rule Name	if E contains	then add
rdf1	uuu aaa yyy .	aaa rdf:type rdf:Property .
rdf2	uuu aaa lll . where lll is a well-typed XML literal	_:nnn rdf:type rdf:XMLLiteral . where _:nnn identifies a blank node allocated to lll by rule lg.

## Table of Contents

1. An introduction to knowledge representation formalisms
2. Resource Description Framework (RDF)
  - 2.1. RDF primitives
  - 2.2. Reasoning with RDF
3. **RDF Schema**
  - 3.1 RDF Schema primitives
  - 3.2 Reasoning with RDFS
4. RDF(S) management APIs
5. RDF(S) query languages: SPARQL

## RDFS: RDF Schema

- **W3C Recommendation**
- **RDF Schema extends RDF to enable talking about classes of resources, and the properties to be used with them.**
  - Class definition: `rdfs:Class`, `rdfs:subClassOf`
  - Property definition: `rdfs:subPropertyOf`, `rdfs:range`, `rdfs:domain`
  - Other primitives: `rdfs:comment`, `rdfs:label`, `rdfs:seeAlso`, `rdfs:isDefinedBy`
- **RDFS vocabulary adds constraints on models, e.g.:**
  - $\forall x,y,z$  `type(x,y)` and `subClassOf(y,z)`  $\rightarrow$  `type(x,z)`

## RDF(S) = RDF + RDF Schema. RDF/XML syntax

```
<?xml version="1.0"?>
<rdf:RDF
  xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xmlns:person="http://www.ontologies.org/ontologies/people#"
  xmlns:rdfs="http://www.w3.org/2000/01/rdf-schema#"
  xmlns="http://www.oeg-upm.net/ontologies/people#"
  xml:base="http://www.oeg-upm.net/ontologies/people">
  <rdfs:Class rdf:about="http://www.ontologies.org/ontologies/people#Professor">
    <rdfs:subClassOf>
      <rdfs:Class rdf:about="http://www.ontologies.org/ontologies/people#Person"/>
    </rdfs:subClassOf>
  </rdfs:Class>
  <rdfs:Class rdf:about="http://www.ontologies.org/ontologies/people#Lecturer">

## Exercise

### •Objective

- Understand how to RDF(S) reasoning works

### •Tasks

- Generate all possible RDF triples that can be inferred from an RDF(S) graph

## Exercise

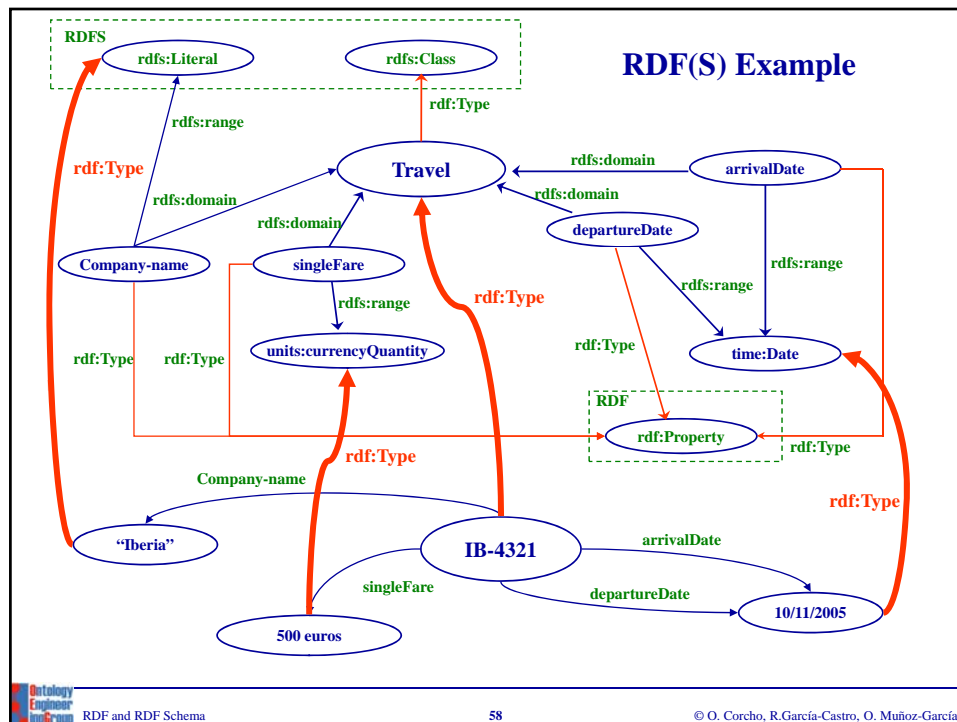

### •Objective

- Understand how to use an RDF(S) development tool to create RDF(S) ontologies

### •Tasks

- Create the previous ontologies in an RDF(S) development tool

## Exercise

### •Objective

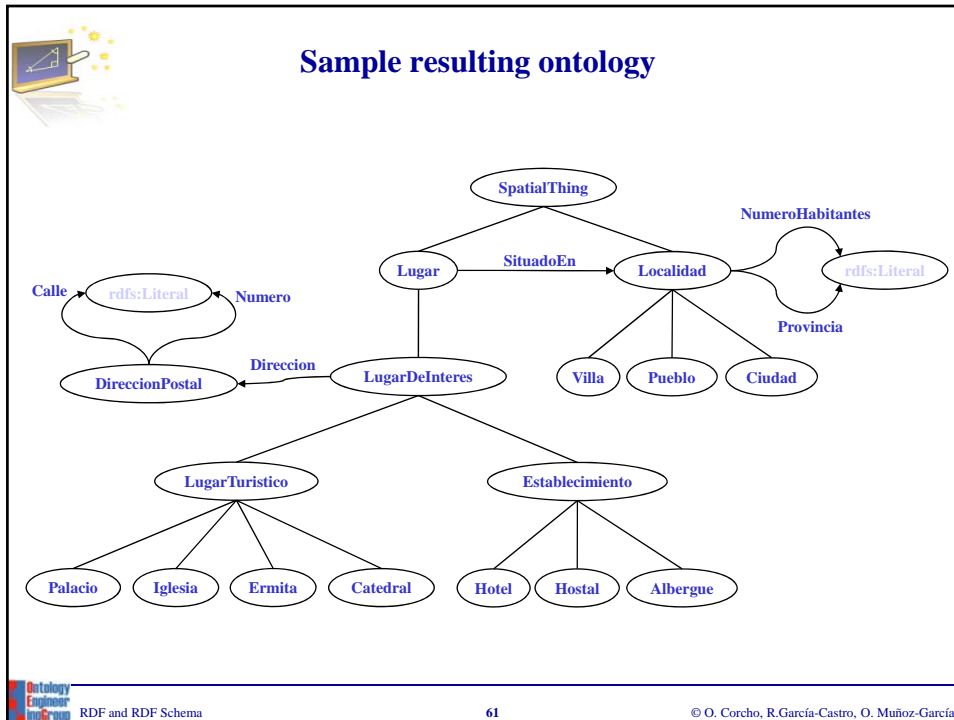

- Understand the features of RDF(S) for implementing ontologies, including its limitations

### •Tasks

- Take the ontologies previously defined and create their graphs
  - First only include the vocabulary from the domain
  - Then include references to the RDF and RDFS vocabularies

## Domain description

- Un lugar puede ser un lugar de interés.
- Los lugares de interés pueden ser lugares turísticos o establecimientos, pero no las dos cosas a la vez.
- Los lugares turísticos pueden ser palacios, iglesias, ermitas y catedrales.
- Los establecimientos pueden ser hoteles, hostales o albergues.
- Un lugar está situado en una localidad, la cual a su vez puede ser una villa, un pueblo o una ciudad.
- Un lugar de interés tiene una dirección postal que incluye su calle y su número.
- Las localidades tienen un número de habitantes.
- Las localidades se encuentran situadas en provincias.
  
- Covarrubias es un pueblo con 634 habitantes de la provincia de Burgos.
- El restaurante “El Galo” está situado en Covarrubias, en la calle Mayor, número 5.
- Una de las iglesias de Covarrubias está en la calle de Santo Tomás.

## Sample RDF APIs

### RDF libraries for different languages:

- Java, Python, C, C++, C#, .Net, Javascript, Tcl/Tk, PHP, Lisp, Obj-C, Prolog, Perl, Ruby, Haskell
- List in <http://esw.w3.org/topic/SemanticWebTools>

### Usually related to a RDF repository

- **Multilanguage:**

- Redland RDF Application Framework (C, Perl, PHP, Python and Ruby):  
<http://www.redland.opensource.ac.uk/>

- **Java:**

- Jena: <http://jena.sourceforge.net/>
- Sesame: <http://www.openrdf.org/>

- **PHP:**

- RAP - RDF API for PHP: <http://www4.wiwiwiss.fu-berlin.de/bizer/rdfapi/>

- **Python:**

- RDFLib: <http://rdflib.net/>
- Pyrp: <http://infomesh.net/pyrp/>

## Jena

- **Java framework for building Semantic Web applications**
- **Open source software from HP Labs:**
- **The Jena framework includes:**
  - A RDF API
  - An OWL API
  - Reading and writing RDF in RDF/XML, N3 and N-Triples
  - In-memory and persistent storage
  - A rule based inference engine
  - SPARQL query engine

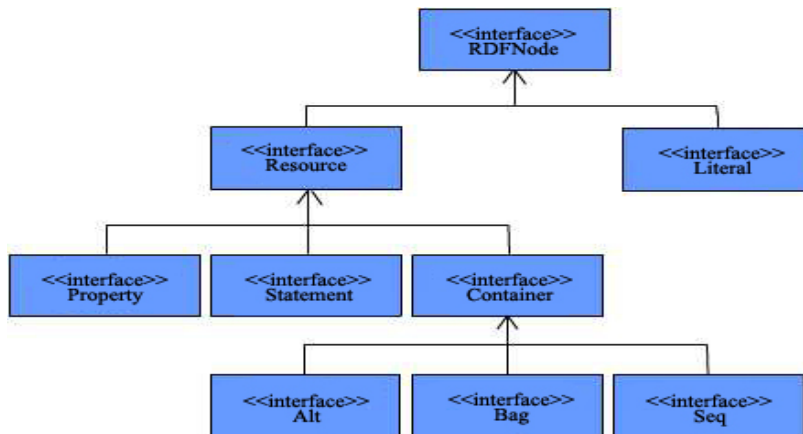

## Sesame

- A framework for *storage, querying and inferencing* of RDF and RDF Schema
- A Java Library for handling RDF
- A Database Server for (remote) access to *repositories* of RDF data
- Highly expressive query and transformation languages
  - SeRQL, SPARQL
- Various backends
  - Native Store
  - RDBMS (MySQL, Oracle 10, DB2, PostgreSQL)
  - main memory
- Reasoning support
  - RDF Schema reasoner
  - OWL DLP (OWLIM)
  - domain reasoning (custom rule engine)

## Table of Contents

1. An introduction to knowledge representation formalisms
2. Resource Description Framework (RDF)

5. RDF(S) query languages: SPARQL

## Jena API Structure

## Data Model

```
// some definitions
static String personURI = "http://somewhere/JohnSmith";
static String fullName = "John Smith";
// create an empty Model
Model model = ModelFactory.createDefaultModel();
// create the resource
Resource johnSmith = model.createResource(personURI);
// add the property
johnSmith.addProperty(VCARD.FN, fullName);
```

## Another data model

```
// some definitions
String personURI = "http://somewhere/JohnSmith"; String givenName = "John";
String familyName = "Smith";
String fullName = givenName + " " + familyName;
// create an empty
Model model = ModelFactory.createDefaultModel();
// create the resource
// and add the properties cascading style
Resource johnSmith = model.createResource(personURI)
    .addProperty(VCARD.FN, fullName)
    .addProperty(VCARD.N, model.createResource())
    .addProperty(VCARD.Given, givenName)
    .addProperty(VCARD.Family, familyName));
```

## Statements

```
// list the statements in the Model
StmtIterator iter = model.listStatements();
// print out the predicate, subject and object of each statement
while (iter.hasNext())
{
    Statement stmt = iter.nextStatement(); // get next statement
    Resource subject = stmt.getSubject(); // get the subject
    Property predicate = stmt.getPredicate(); // get the predicate
    RDFNode object = stmt.getObject(); // get the object
    System.out.print(subject.toString());
    System.out.print(" " + predicate.toString() + " ");
    if (object instanceof Resource) {
        System.out.print(object.toString());
    }
    else { // object is a literal
        System.out.print(" \"" + object.toString() + "\"");
    }
    System.out.println(" .");
} // end of while
```

```
http://somewhere/JohnSmith http://www.w3.org/2001/vcard-rdf/3.0#N anon:14df86:ecc3dee17b:-7fff
anon:14df86:ecc3dee17b:-7fff http://www.w3.org/2001/vcard-rdf/3.0#Family "Smith"
anon:14df86:ecc3dee17b:-7fff http://www.w3.org/2001/vcard-rdf/3.0#Given "John"
http://somewhere/JohnSmith http://www.w3.org/2001/vcard-rdf/3.0#FN
"John Smith" .
```

## Writing RDF

```
Model model = ModelFactory.createDefaultModel();
Resource jsmith =
model.createResource("http://somewhere/johnsmith")
    .addProperty(VCARD.FN, "John Smith")
    .addProperty(VCARD.N, model.createResource()
        .addProperty(VCARD.Given, "John")
        .addProperty(VCARD.Family, "Smith"));
model.write(new PrintWriter(System.out));
```

```
model.write(System.out, "RDF/XML-ABBREV");
model.write(System.out, "N-TRIPLE");
```

```
<rdf:RDF
  xmlns:rdf='http://www.w3.org/1999/02/22-rdf-syntax-ns#'
  xmlns:vcard='http://www.w3.org/2001/vcard-rdf/3.0#'
>
  <rdf:Description rdf:nodeID='A0'>
    <vcard:Given>John</vcard:Given>
    <vcard:Family>Smith</vcard:Family>
  </rdf:Description>
  <rdf:Description rdf:about='http://somewhere/johnsmith'>
    <vcard:FN>John Smith</vcard:FN>
    <vcard:N rdf:nodeID='A0' />
  </rdf:Description>
</rdf:RDF>
```

## Reading RDF

```
// create an empty model
Model model = ModelFactory.createDefaultModel();

// use the FileManager to find the input file
InputStream in = FileManager.get().open( inputFileName );
if (in == null) {
    throw new IllegalArgumentException("File not found");
}

// read the RDF/XML file
model.read(in, "");

// write it to standard out
model.write(System.out);
```

```
<rdf:RDF
  xmlns:rdf='http://www.w3.org/1999/02/22-rdf-syntax-ns#'
  xmlns:vcard='http://www.w3.org/2001/vcard-rdf/3.0#'
>
  <rdf:Description rdf:nodeID="A0">
    <vcard:Family>Smith</vcard:Family>
    <vcard:Given>John</vcard:Given>
  </rdf:Description>
  <rdf:Description rdf:about='http://somewhere/JohnSmith/'>
    <vcard:FN>John Smith</vcard:FN>
    <vcard:N rdf:nodeID="A0" />
  </rdf:Description>
  ...
</rdf:RDF>
```

## Navigating a model

```
// retrieve the John Smith vcard resource from the model
Resource vcard = model.getResource(johnSmithURI);
```

Three ways of retrieving property values:

```
// retrieve the value of the N property
Resource name = (Resource) vcard.getProperty(VCARD.N).getObject();
```

```
// retrieve the value of the N property
Resource name = vcard.getProperty(VCARD.N).getResource();
```

```
// retrieve the given name property
String fullName = vcard.getProperty(VCARD.N).getString();
```

## Multiple values in properties

```
// add two nickname properties to vcard
vcard.addProperty(VCARD.NICKNAME, "Smithy")
    .addProperty(VCARD.NICKNAME, "Adman");

// set up the output
System.out.println("The nicknames of \"" + fullName + "\"" + " are:");

// list the nicknames
StmtIterator iter = vcard.listProperties(VCARD.NICKNAME);
while (iter.hasNext()) {
    System.out.println(" " + iter.nextStatement().getObject().toString());
}
```

## Querying a model

```
// select all the resources with a VCARD.FN property
ResIterator iter = model.listSubjectsWithProperty(VCARD.FN);
if (iter.hasNext()) {
    System.out.println("The database contains vcards for:");
    while (iter.hasNext()) {
        System.out.println(" " + iter.nextStatement()
                           .getProperty(VCARD.FN).getString());
    }
} else {
    System.out.println("No vcards were found in the database");
}
```

The database contains vcards for:

Sarah Jones  
John Smith  
Matt Jones  
Becky Smith

## Create resources

```
// URI declarations
String familyUri = "http://family/";
String relationshipUri = "http://purl.org/vocab/relationship/";

// Create an empty Model
Model model = ModelFactory.createDefaultModel();

// Create a Resource for each family member, identified by their URI
Resource adam = model.createResource(familyUri+"adam");
Resource beth = model.createResource(familyUri+"beth");
Resource dotty = model.createResource(familyUri+"dotty");
// and so on for other family members

// Create properties for the different types of relationship to represent
Property childOf = model.createProperty(relationshipUri,"childOf");
Property parentOf = model.createProperty(relationshipUri,"parentOf");
Property siblingOf = model.createProperty(relationshipUri,"siblingOf");
Property spouseOf = model.createProperty(relationshipUri,"spouseOf");

// Add properties to adam describing relationships to other family members
adam.addProperty(siblingOf,beth);
adam.addProperty(spouseOf,dotty);
adam.addProperty(parentOf,edward);

// Can also create statements directly . . .
Statement statement = model.createStatement(adam,parentOf,fran);

// but remember to add the created statement to the model
model.add(statement);
```

## Querying a model

```
// List everyone in the model who has a child:
ResIterator parents = model.listSubjectsWithProperty(parentOf);

// Because subjects of statements are Resources, the method returned a ResIterator
while (parents.hasNext()) {

    // ResIterator has a typed nextResource() method
    Resource person = parents.nextResource();

    // Print the URI of the resource
    System.out.println(person.getURI());
}

// Can also find all the parents by getting the objects of all "childOf" statements
// Objects of statements could be Resources or literals, so the Iterator returned
// contains RDFNodes
NodeIterator moreParents = model.listObjectsOfProperty(childOf);

// To find all the siblings of a specific person, the model itself can be queried
NodeIterator siblings = model.listObjectsOfProperty(edward, siblingOf);

// But it's more elegant to ask the Resource directly
// This method yields an iterator over Statements
StmtIterator moreSiblings = edward.listProperties(siblingOf);
```

## Using selectors to query a model

```
// Find the exact statement "adam is a spouse of dotty"
model.listStatements(adam, spouseOf, dotty);

// Find all statements with adam as the subject and dotty as the object
model.listStatements(adam, null, dotty);

// Find any statements made about adam
model.listStatements(adam, null, null);

// Find any statement with the siblingOf property
model.listStatements(null, siblingOf, null);
```

## Exercise

### •Objective

- Understand how to use an RDF(S) management API

### •Tasks

- Read an ontology in RDF(S) from two files:
  - GP\_Santiago.rdf (conceptualization)
  - GP\_Santiago.rdfs (instances)
- Write the class hierarchy of the ontology, including the instances of each class

## Hands-on

- To read an ontology in RDF(S) from two files:
  - GP\_Santiago.rdf (conceptualization)
  - GP\_Santiago.rdfs (instances)
- To write the class hierarchy of the ontology, including the instances of each class:

```
Class Practica2:MedioTransporte
  Class Practica2:Tren
  Class Practica2:Bicicleta
    Instance Practica2:GP_Santiago_Instance_70
  Class Practica2:Automovil
  Class Practica2:AutoBus
  Class Practica2:APie
Class Practica2:InfraEstructuraTransporte
  Class Practica2:ViaFerreia
  Class Practica2:Sendero
  Class Practica2:Carretera
    Instance Practica2:A6
...
```

## Set up

- **Requirements:**
    - Java JDK 5
    - Eclipse (optional)
  - **Create a directory for your project**
  - **Install Jena from the USB:**
    - Unzip *Jena-2.5.5.zip/lib* in the project directory
  - **Copy the ontologies from the USB:**
    - Copy *ontologies/rdf* in the project directory
- } Or copy the JenaProjectTemplate directory in your computer
- **In Eclipse:**
    - Create a new Java project (from existing source)
    - Append the Jena libraries to your classpath if needed (check JDK libs)
    - Write Java code using the Jena API  
<http://jena.sourceforge.net/javadoc/index.html>
    - Compile
    - Run

## Hints

- **Create ontology model:**

```
public static OntModel  
    createOntologyModel(OntModelSpec spec)
```
- **Read the ontology in the file**

```
Model read(java.lang.String url)
```
- **Add all the statements in another model to this model**

```
Model add(Model m)
```

## More hints

- **List root classes**

```
ExtendedIterator listHierarchyRootClasses()
```

- **List subclasses of a class**

```
ExtendedIterator listSubClasses(boolean  
direct)
```

- **List instances of a class**

```
ExtendedIterator listInstances(boolean direct)
```

## Table of Contents

1. An introduction to knowledge representation formalisms
2. Resource Description Framework (RDF)
3. RDF Schema
4. RDF(S) management APIs
5. **RDF(S) query languages: SPARQL**
  - 5.1 RDF(S) query languages and SPARQL
  - 5.2 Turtle RDF syntax
  - 5.3 Graph patterns
  - 5.4 Restricting values and solutions
  - 5.5 SPARQL query forms
  - 5.6 Hands-on activity

## RDF(S) query languages

- Languages developed to allow accessing datasets expressed in RDF(S) (and in some cases OWL)

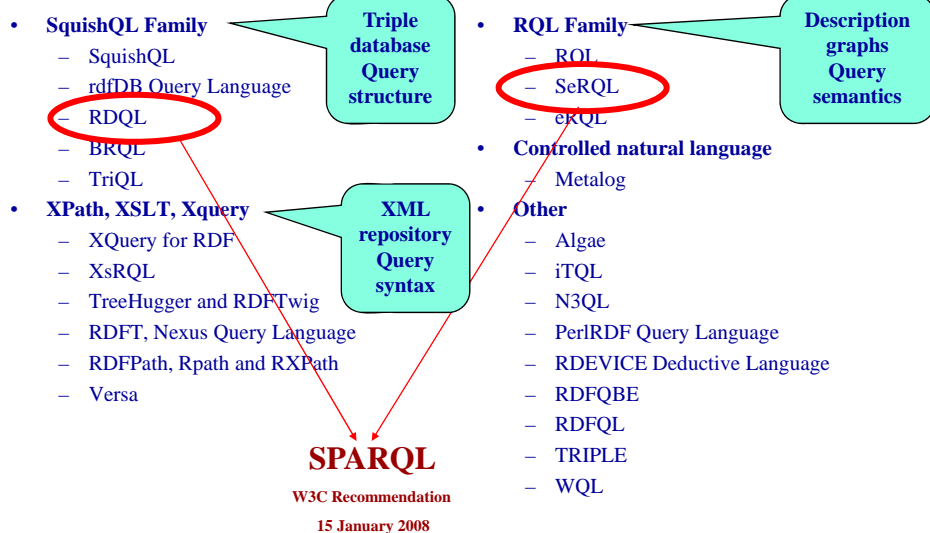

- Supported by the most important language APIs
  - Jena (HP labs)
  - Sesame (Aduna)
  - Boca (IBM)
  - ...
- There are some differences wrt languages like SQL, such as
  - Combination of different sources
  - Trust management
  - Open World Assumption

## Query types

- **Selection and extraction**
  - “Select all the essays, together with their authors and their authors’ names”.
  - “Select everything that is related to the book ‘Bellum Civile’”
- **Reduction**: we specify what it should not be returned
  - “Select everything except for the ontological information and the book translators”
- **Restructuring**: the original structure is changed in the final result
  - “Invert the relationship ‘author’ by ‘is author of’”
- **Aggregation**
  - “Return all the essays together with the mean number of authors per essay”
- **Combination and inferences**
  - “Combine the information of a book called ‘La guerra civil’ and whose author is Julius Caesar with the book whose identifier is ‘Bellum Civile’”
  - “Select all the essays, together with its authors and author names”, *including also the instances of the subclasses of Essay*.
  - “Obtain the relationship ‘coauthor’ among persons who have written the same book”.

## RDF(S) query language families

## SPARQL

- **SPARQL Protocol and RDF Query Language**
- **Supported by:** Jena, Sesame, IBM Boca, etc.
- **Features**
  - It supports most of the aforementioned queries
  - It supports **datatype reasoning** (datatypes can be requested instead of actual values)
  - **The domain vocabulary and the knowledge representation vocabulary are treated differently by the query interpreters.**
  - It allows making queries over properties with multiple values, over multiple properties of a resource and over **reifications**
  - Queries can contain **optional statements**
  - Some implementations support **aggregation queries**
- **Limitations**
  - Neither **set operations** nor **existential or universal quantifiers** can be included in the queries
  - It does not support **recursive queries**

## SPARQL is also a protocol

- SPARQL is a Query Language ...:  
*Find names and websites of contributors to PlanetRDF:*  

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?name ?website
FROM <http://planetrdf.com/bloggers.rdf>
WHERE {
    ?person foaf:weblog ?website .
    ?person foaf:name ?name .
    ?website a foaf:Document }
```
- ... and a Protocol.  

```
http://.../qps?query-lang=http://www.w3.org/TR/rdf-sparql-query/
&graph-id=http://planetrdf.com/bloggers.rdf&query=PREFIXfoaf:
<http://xmlns.com/foaf/0.1/...
```
- Services running SPARQL queries over a set of graphs
- A transport protocol for invoking the service
- Based on ideas from earlier protocol work such as Joseki
- Describing the service with Web Service technologies

## A simple SPARQL query

### Data:

```
@prefix dc: <http://purl.org/dc/elements/1.1/> .
@prefix : <http://example.org/book/> .
:book1 dc:title "SPARQL Tutorial" .
```

### Query:

```
SELECT ?title
WHERE
{
    <http://example.org/book/book1> <http://purl.org/dc/elements/1.1/title> ?title .
}
```

### Query result:

title
"SPARQL Tutorial"

- A pattern is *matched* against the RDF data
- Each way a pattern can be matched yields a solution
- The sequence of solutions is filtered by: Project, distinct, order, limit/offset
- One of the result forms is applied: SELECT, CONSTRUCT, DESCRIBE, ASK

## Table of Contents

1. An introduction to knowledge representation formalisms
2. Resource Description Framework (RDF)
3. RDF Schema
4. RDF(S) management APIs
5. **RDF(S) query languages: SPARQL**
  - 5.1 RDF(S) query languages and SPARQL
  - 5.2 **Turtle RDF syntax**
  - 5.3 Graph patterns
  - 5.4 Restricting values and solutions
  - 5.5 SPARQL query forms
  - 5.6 Hands-on activity

## Turtle: URIs, blank nodes, literals

- **URIs**
  - Enclosed in `<>`
  - `<URI>`
  - or
  - `@prefix prefix <http://....>`
  - `prefix:name`
- **Blank Nodes**
  - `:name`
  - or
  - `[]` for a Blank Node used once
- **Literals**
  - `"Literal"`
  - `"Literal"@language`
  - `" " "Long literal with newlines" "`
- **Datatypes Literals**
  - `"lexical form"^^datatype URI`
  - `"10"^^xsd:integer`
  - `"2006-09-04"^^xsd:date`

## Turtle: Triples and abbreviations

- **Triples separated by .**  
:a :b :c . :d :e :f .
- **Common triple predicate and subject:**  
:a :b :c, :d .  
which is the same as :a :b :c . :a :b :d .
- **Common triple subject:**  
:a :b :c; :d :e .  
which is the same as: :a :b :c . :a :d :e .
- **Blank node as a subject**  
:a :b [ :c :d ]  
which is the same as: :a :b \_:x . \_:x :c :d .  
for blank node \_:x
- **RDF Collections**
  - :a :b ( :c :d :e :f )  
which is short for many triples

## Table of Contents

1. An introduction to knowledge representation formalisms
2. Resource Description Framework (RDF)
3. RDF Schema
4. RDF(S) management APIs
5. **RDF(S) query languages: SPARQL**
  - 5.1 RDF(S) query languages and SPARQL
  - 5.2 Turtle RDF syntax
  - 5.3 **Graph patterns**
  - 5.4 Restricting values and solutions
  - 5.5 SPARQL query forms
  - 5.6 Hands-on activity

## Graph patterns

- **Basic Graph Patterns**, where a set of triple patterns must match
- **Group Graph Pattern**, where a set of graph patterns must all match
- **Optional Graph patterns**, where additional patterns may extend the solution
- **Alternative Graph Pattern**, where two or more possible patterns are tried
- **Patterns on Named Graphs**, where patterns are matched against named graphs

## Basic graph patterns: Multiple matches

```
@prefix foaf: <http://xmlns.com/foaf/0.1/> .  
  
_:a foaf:name "Johnny Lee Outlaw" .  
_:a foaf:mbox <mailto:jlow@example.com> .  
_:b foaf:name "Peter Goodguy" .  
_:b foaf:mbox <mailto:peter@example.org> .  
_:c foaf:mbox <mailto:carol@example.org> .
```

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>  
SELECT ?name ?mbox  
WHERE  
{ ?x foaf:name ?name .  
  ?x foaf:mbox ?mbox }
```

name	mbox
"Johnny Lee Outlaw"	<mailto:jlow@example.com>
"Peter Goodguy"	<mailto:peter@example.org>

## Basic graph patterns: Matching RDF literals

```
@prefix dt: <http://example.org/datatype#> .
@prefix ns: <http://example.org/ns#> .
@prefix : <http://example.org/ns#> .
@prefix xsd: <http://www.w3.org/2001/XMLSchema#> .

:x ns:p "cat"@en .
:y ns:p "42"^^xsd:integer .
:z ns:p "abc"^^dt:specialDatatype .
```

```
SELECT ?v WHERE { ?v ?p "cat" }
```

v
---

```
SELECT ?v WHERE { ?v ?p "cat"@en }
```

v
---

<http://example.org/ns#x>
---------------------------

```
SELECT ?v WHERE { ?v ?p 42 }
```

v
---

<http://example.org/ns#y>
---------------------------

```
SELECT ?v WHERE { ?v ?p "abc"^^<http://example.org/datatype#specialDatatype> }
```

v
---

<http://example.org/ns#z>
---------------------------

## Basic graph patterns: Blank node labels in query results

```
@prefix foaf: <http://xmlns.com/foaf/0.1/> .

_:a foaf:name "Alice" .
_:b foaf:name "Bob" .
```

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
```

```
SELECT ?x ?name
```

```
WHERE { ?x foaf:name ?name }
```

x	name
_:c	"Alice"
_:d	"Bob"

=

x	name
_:r	"Alice"
_:s	"Bob"

## Group graph pattern

```
PREFIX foaf:    <http://xmlns.com/foaf/0.1/>
SELECT ?name ?mbox
WHERE  { { ?x foaf:name ?name . }
        { ?x foaf:mbox ?mbox . }
      }
```

```
SELECT ?x
WHERE {}
```

```
PREFIX foaf:    <http://xmlns.com/foaf/0.1/>
SELECT ?name ?mbox
WHERE  { { ?x foaf:name ?name . }
        { ?x foaf:mbox ?mbox . FILTER regex(?name, "Smith")}
      }
```

## Optional graph patterns

```
@prefix foaf:    <http://xmlns.com/foaf/0.1/> .
@prefix rdf:     <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .

_:a  rdf:type      foaf:Person .
_:a  foaf:name     "Alice" .
_:a  foaf:mbox     <mailto:alice@example.com> .
_:a  foaf:mbox     <mailto:alice@work.example> .

_:b  rdf:type      foaf:Person .
_:b  foaf:name     "Bob" .
```

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?name ?mbox
WHERE { ?x foaf:name ?name .
       OPTIONAL { ?x foaf:mbox ?mbox }
}
```

name	mbox
"Alice"	<mailto:alice@example.com>
"Alice"	<mailto:alice@work.example>
"Bob"	

## Multiple optional graph patterns

```
@prefix foaf: <http://xmlns.com/foaf/0.1/> .  
_:a foaf:name "Alice" .  
_:a foaf:homepage <http://work.example.org/alice/> .  
  
_:b foaf:name "Bob" .  
_:b foaf:mbox <mailto:bob@work.example> .
```

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>  
SELECT ?name ?mbox ?hpage  
WHERE {  
  { ?x foaf:name ?name .  
    OPTIONAL { ?x foaf:mbox ?mbox } .  
    OPTIONAL { ?x foaf:homepage ?hpage }  
  }  
}
```

name	mbox	hpage
"Alice"		<http://work.example.org/alice/>
"Bob"	<mailto:bob@work.example>	

## Alternative graph patterns

```
@prefix dc10: <http://purl.org/dc/elements/1.0/> .  
@prefix dc11: <http://purl.org/dc/elements/1.1/> .  
  
_:a dc10:title "SPARQL Query Language Tutorial" .

## Restricting values

```
@prefix dc: <http://purl.org/dc/elements/1.1/> .
@prefix : <http://example.org/book/> .
@prefix ns: <http://example.org/ns#> .

:book1 dc:title "SPARQL Tutorial" .
:book1 ns:price 42 .
:book2 dc:title "The Semantic Web" .
:book2 ns:price 23 .
```

```
PREFIX dc: <http://purl.org/dc/elements/1.1/>
SELECT ?title
WHERE {
  ?x dc:title ?title
  FILTER regex(?title, "^SPARQL")
}
```

title
"SPARQL Tutorial"

```
PREFIX dc: <http://purl.org/dc/elements/1.1/>
SELECT ?title
WHERE {
  ?x dc:title ?title
  FILTER regex(?title, "web", "i" )
}
```

title
"The Semantic Web"

```
PREFIX dc: <http://purl.org/dc/elements/1.1/>
PREFIX ns: <http://example.org/ns#>
SELECT ?title ?price
WHERE {
  ?x ns:price ?price .
  FILTER (?price < 30.5)
  ?x dc:title ?title .
}
```

title	price
"The Semantic Web"	23

## Value tests

- Based on XQuery 1.0 and XPath 2.0 Function and Operators
- XSD boolean, string, integer, decimal, float, double, dateTime
- Notation <, >, =, <=, >= and != for value comparison  
Apply to any type
- BOUND, isURI, isBLANK, isLITERAL
- REGEX, LANG, DATATYPE, STR (lexical form)
- Function call for casting and extensions functions

## Solution sequences and modifiers

- **Order modifier:** put the solutions in order  

```
SELECT ?name
WHERE { ?x foaf:name ?name ; :empId ?emp }
ORDER BY ?name DESC(?emp)
```
- **Projection modifier:** choose certain variables  

```
SELECT ?name
WHERE
{ ?x foaf:name ?name }
```
- **Distinct modifier:** ensure solutions in the sequence are unique  

```
SELECT DISTINCT ?name
WHERE { ?x foaf:name ?name }
```
- **Reduced modifier:** permit elimination of some non-unique solutions  

```
SELECT REDUCED ?name
WHERE { ?x foaf:name ?name }
```
- **Offset modifier:** control where the solutions start from in the overall sequence of solutions  

```
SELECT ?name WHERE { ?x foaf:name ?name }
ORDER BY ?name
LIMIT 5
OFFSET 10
```
- **Limit modifier:** restrict the number of solutions  

```
SELECT ?name
WHERE { ?x foaf:name ?name }
LIMIT 20
```

## SPARQL query forms

- **SELECT**
  - Returns all, or a subset of, the variables bound in a query pattern match.
- **CONSTRUCT**
  - Returns an RDF graph constructed by substituting variables in a set of triple templates.
- **ASK**
  - Returns a boolean indicating whether a query pattern matches or not.
- **DESCRIBE**
  - Returns an RDF graph that describes the resources found.

## SPARQL query forms: SELECT

```
@prefix foaf: <http://xmlns.com/foaf/0.1/> .

_:a foaf:name "Alice" .
_:a foaf:knows _:b .
_:a foaf:knows _:c .

_:b foaf:name "Bob" .

_:c foaf:name "Clare" .
_:c foaf:nick "CT" .
```

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?nameX ?nameY ?nickY
WHERE
{
  ?x foaf:knows ?y ;
    foaf:name ?nameX .
  ?y foaf:name ?nameY .
  OPTIONAL { ?y foaf:nick ?nickY }
}
```

nameX	nameY	nickY
"Alice"	"Bob"	
"Alice"	"Clare"	"CT"

## SPARQL query forms: CONSTRUCT

```
@prefix foaf: <http://xmlns.com/foaf/0.1/> .

_:a foaf:name "Alice" .
_:a foaf:mbox <mailto:alice@example.org> .
```

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
PREFIX vcard: <http://www.w3.org/2001/vcard-rdf/3.0#>

CONSTRUCT { <http://example.org/person#Alice> vcard:FN ?name }

WHERE { ?x foaf:name ?name }
```

### Query result:

```
@prefix vcard: <http://www.w3.org/2001/vcard-rdf/3.0#> .

<http://example.org/person#Alice> vcard:FN "Alice" .
```

## SPARQL query forms: ASK

```
@prefix foaf:      <http://xmlns.com/foaf/0.1/> .

_:a  foaf:name      "Alice" .
_:a  foaf:homepage  <http://work.example.org/alice/> .

_:b  foaf:name      "Bob" .
_:b  foaf:mbox      <mailto:bob@work.example> .
```

```
PREFIX foaf:      <http://xmlns.com/foaf/0.1/>
ASK { ?x foaf:name "Alice" }
```

Query result:

yes

## SPARQL query forms: DESCRIBE

```
PREFIX ent: <http://org.example.com/employees#>
DESCRIBE ?x WHERE { ?x ent:employeeId "1234" }
```

Query result:

```
@prefix foaf:      <http://xmlns.com/foaf/0.1/> .
@prefix vcard:     <http://www.w3.org/2001/vcard-rdf/3.0> .
@prefix exOrg:     <http://org.example.com/employees#> .
@prefix rdf:       <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .
@prefix owl:     <http://www.w3.org/2002/07/owl#>

_:a      exOrg:employeeId      "1234" ;

        foaf:mbox_shalsum      "ABCD1234" ;
        vcard:N
        [ vcard:Family          "Smith" ;
          vcard:Given            "John" ] .

foaf:mbox_shalsum  rdf:type     owl:InverseFunctionalProperty .
```

## Exercise

### •Objective

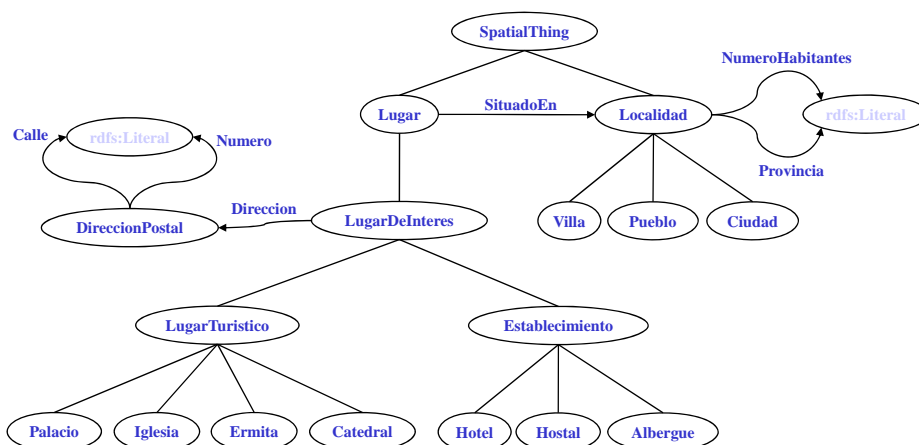

- Understand how to perform SPARQL queries

### •Tasks

- Perform a set of SPARQL queries over the sample ontology.
  - Browse to:
    - <http://my.computer.ip:8080/openrdf-workbench>
  - Select repository GP-native-rdfs
  - Select the Query option from the left menu

## Sample ontology

## Queries on the model

### 1) Get all the classes

```
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?x WHERE { ?x a rdfs:Class. }
```

### 2) Get the subclasses of the class *Establecimiento*

```
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
SELECT ?x WHERE { ?x rdfs:subClassOf pr:Establecimiento. }
```

### 3) Get the instances of the class *Ciudad*

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
SELECT ?x WHERE { ?x a pr:Ciudad. }
```

## Queries on the instances

### 4) Get the number of inhabitants of *Santiago de Compostela*

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
SELECT ?x WHERE { pr:Santiago_de_Compostela pr:NumeroHabitantes ?x. }
```

### 5) Get the number of inhabitants of *Santiago de Compostela* and of *Arzua*

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
SELECT ?x WHERE {
    {pr:Santiago_de_Compostela pr:NumeroHabitantes ?x.}
    UNION
    {pr:Arzua pr:NumeroHabitantes ?x.}
}
```

### 6) Get different places with the inhabitants number, ordering the results by the name of the place (ascending)

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?x ?y WHERE { $sitio pr:NumeroHabitantes ?y;
                      rdfs:label ?x.}

ORDER BY ASC(?x)
```

## Queries on the instances II

### 7) Get all the instances of *Localidad* with their inhabitant number (if it exists)

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?x ?y WHERE { $sitio a pr:Localidad;
                      rdfs:label ?x.
                      OPTIONAL { $sitio pr:NumeroHabitantes ?y. } }
```

### 8) Get all the places with more than 200.000 inhabitants

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?x ?y WHERE { $sitio pr:NumeroHabitantes ?y;
                      rdfs:label ?x.
                      FILTER(?y > 200000) }
```

### 9) Get postal data of *Pazo de Breogan* (calle, número, localidad, provincia)

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?calle ?numero ?poblacion ?provincia
WHERE { pr:Pazo_Breogan pr:SituadoEn $pob;
        pr:Direccion $dir.
        $pob rdfs:label ?poblacion;
        pr:Provincia ?provincia.
        $dir pr:Calle ?calle;
        pr:Numero ?numero. }
```

## Queries with inference

### 10) Get the subclasses of class *Lugar*

```
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
SELECT ?x WHERE { ?x rdfs:subClassOf pr:Lugar. }
```

### 11) Get the instances of class *Localidad*

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
SELECT ?x WHERE { ?x a pr:Localidad. }
```

### Special query (SELECT \*)

### 12) Get the values of all the variables in the query

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
SELECT * WHERE { ?x pr:NumeroHabitantes ?y. }
```

## Different query forms

### 13) Describe the resource with *rdfs:label* "Madrid"

```
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
DESCRIBE ?x WHERE { ?x rdfs:label "Madrid". }
```

### 14) Construct the RDF(S) graph that directly relates all the touristic places with their respective provinces, using a new property called "estaEn".

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
CONSTRUCT { ?x pr:estaEn ?y }
WHERE {
    ?x a pr:LugarTuristico;
        pr:SituadoEn $pob.
    $pob pr:Provincia ?y. }
```

### 15) Ask if there is some instance of *Pueblo*

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
ASK WHERE { ?a a pr:Pueblo }
```

### 16) Ask if there is some instance of *Ermita*

```
PREFIX pr: <http://GP-onto.fi.upm.es/Practica2#>
ASK WHERE { ?a a pr:Ermita }
```
