Universidad Politécnica de Madrid

What am I working on?

- Creation of abstractions in scientific workflows
 - •Workflow Traces and template representation
 - Provenance representation
 - Plan representation
 - Abstraction catalog
 - •Find ways to link the definitions to the provenance traces automatically
- Understandability and reuse of scientific workflows

Index

- 1. Motivation
- 2. Overview
- Workflow systems used
- 4. Summary of work done in my previous visit to ISI
 - OPMW and provenance publishing
- 5. Summary of work done before second visit to ISI
 - Workflow motif catalog
- 6. Summary of work done in my second visit to ISI
 - OPMW-PROV and P-PLAN
 - Automatic macro abstraction detection
- 7. Next Steps
- 8. Future work

3

As a designer: Discovery

- •Workflows with similar functionality fragments/methods
- Design based in previous templates.

As user/reuser: Understandability

- Search workflows by functionality
- Commonalities between execution runs
- Component categorization

Overview

Abstraction definitions and categorization

Descriptions/ PSMS/Ontologies

Algorithms for finding the different abstractions automatically

Data mining tools, graph analysis, etc.

Experiment publication

RDF Stores

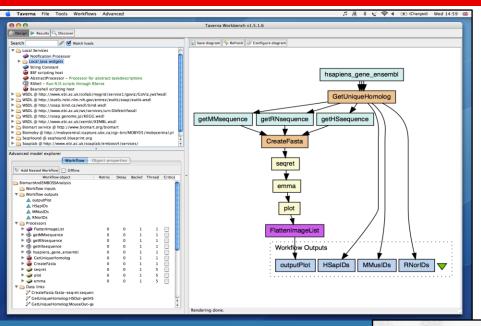

Provenance representation

Plan representation

Plan representation

Virtuoso, Pubby, Wings (+Plugin)

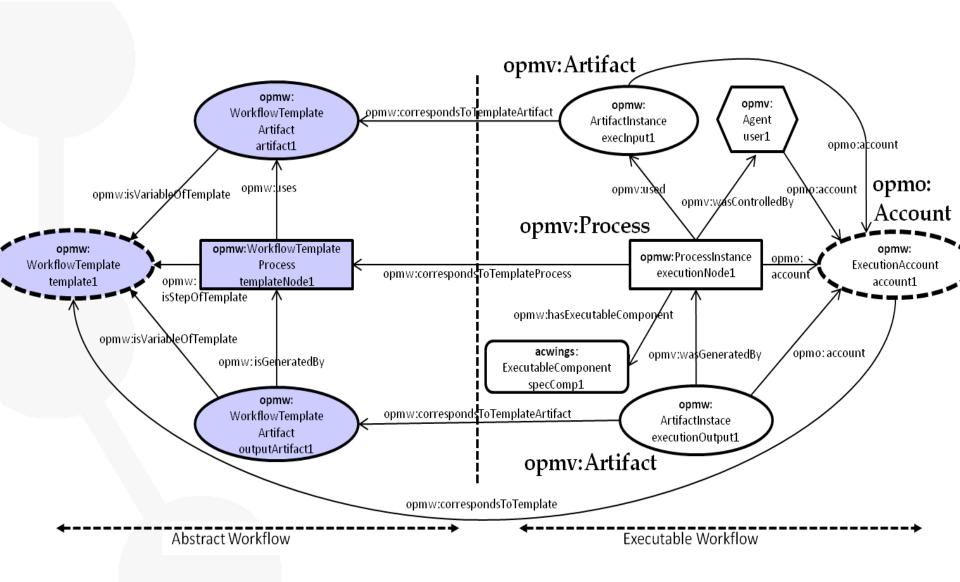

OPMW

 Empirical analysis on 177 workflow templates from Taverna and Wings

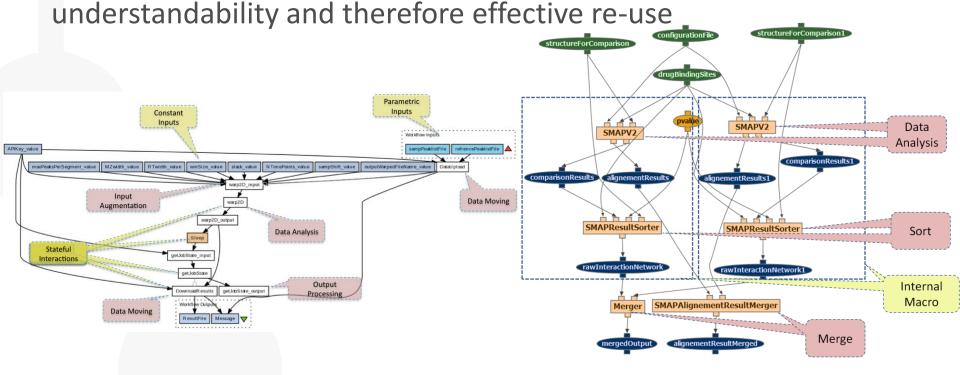

- Catalog of recurring patterns: scientific workflow motifs.
 - Data Oriented Motifs
 - Workflow Oriented Motifs

Understandability and reuse

•Reverse-engineer the set of current practices in workflow development through an analysis of empirical evidence

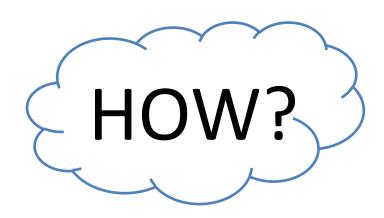

•Identify workflow abstractions that would facilitate

- •Workflow motif: Domain independent conceptual abstraction on the workflow steps.
- 1. Data-oriented motifs: What kind of manipulations does the workflow have?
 - •E.g.:
 - Data retrieval
 - Data preparation
 - etc.

- 2. Workflow-oriented motifs: How does the workflow perform its operations?
 - •E.g.:
 - Stateful steps
 - Stateless steps
 - Human interactions
 - •etc.

Data-Oriented Motifs

Workflow-Oriented Motifs

Data Retrieval

Data Preparation

Format Transformation

Input Augmentation and Output Splitting

Data Organisation

Data Analysis

Data Curation/Cleaning

Data Moving

Data Visualisation

Intra-Workflow Motifs

Stateful (Asynchronous) Invocations

Stateless (Synchronous) Invocations

Internal Macros

Human Interactions

Inter-Workflow Motifs

Atomic Workflows

Composite Workflows

Workflow Overloading

Summary: Work done at ISI

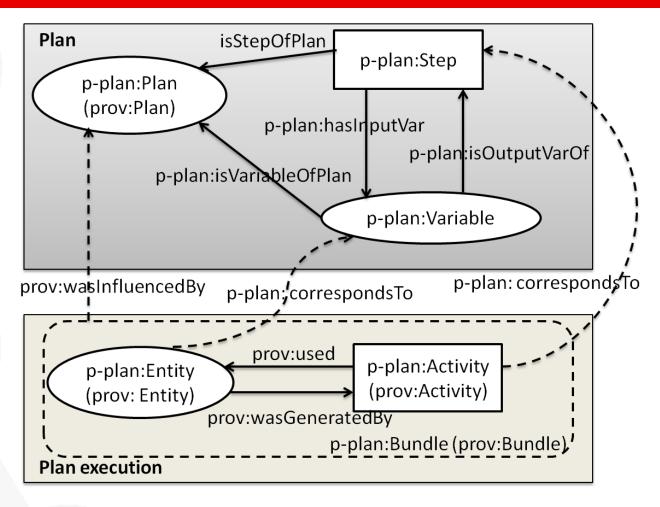

Motif Detection Abstractions definitions and categorization **SUBDUE** exploration and Macro integration in Algorithms for automatic abstraction **RDF** matching detection Virtuoso, **Experiment Publication** Pubby, Wings (+Plugin) OPMW + PROV Plan Provenance + P-PLAN representation representation

PROV Compatibility

OPMW concept	Mapping	PROV Concept	Rationale
			A Workflow Execution Artifact is an immutable
WorkflowExecutionArtifact	rdfs:subclassOf	prov:Entity	resource. Thus, it is a TYPE of entity. A Workflow Execution Process is an activity that
			uses and generates Workflow ExecutionArtifacts.
			Since they are more specific than entities,
WorkflowExecutionProcess	rdfs:subclassOf	prov:Activity	WorkflowExecutionProcess is a type of Activity
			A Workflow Execution Account is a set of
			provenance assertions representing the system
			"view" of the execution. Therefore, it can be
			considered as a type of Bundle. It is more specific,
WorkflowExecutionAccount	rdfs:subclassOf	prov:Bundle	because it only contains assertions about the execution of a workflow.
WOIKITOWEXECUTIONACCOUNT	Turs.subclassOr	prov.bundie	A workflow template can be seen as a general plan
			that contains all the assertions of the template of
			the workflow. We choose to not associate it with
			any activity, although we could create one
			representing the execution of the whole
			workflow. This corresponds to the plan followed to
			execute the whole workflow, not every single
WorkflowTemplate	rdfs:subclassOf	prov:Plan	subactivity.
			This property is used to assert in which system
			where the accounts executed. The workflow
			system is attributed some credit for the creation of
executedInWorkflowSystem	rdfs:subPropertyOf	prov:wasAttributedTo	the provenance assertions (i.e., the bundle).
			This property links a workflow execution process
			with the code used in the actual execution.
			Therefore, we can say that the activity used the
			code. This couls also be modeled as the code being the plan of the association between the executor
			and the process. Since plans are entities, it is
			consistent to infer that they are used by the
hasSpecificComponent	rdfs:subPropertyOf	prov:used	activities, according to prov.
			This property is used to track the provenance of
	-dfb-Dr	AAAdd L	the PLAN. Thus it should be attributed to the
createdInWorkflowSystem	rdfs:subPropertyOf	prov:wasAttributedTo	the PLAN. Thus it should be attributed to the system where it was designed (and also the user)
created in Workflow System	rdfs:subPropertyOf	prov:wasAttributedTo	the PLAN. Thus it should be attributed to the system where it was designed (and also the user) The problem here is that there is a mismatch:
createdInWorkflowSystem	rdfs:subPropertyOf	prov:wasAttributedTo	the PLAN. Thus it should be attributed to the system where it was designed (and also the user)
			the PLAN. Thus it should be attributed to the system where it was designed (and also the user) The problem here is that there is a mismatch: OPMW maps the property to xsd:AanyURI and
			the PLAN. Thus it should be attributed to the system where it was designed (and also the user) The problem here is that there is a mismatch: OPMW maps the property to xsd:AanyURI and PROV considers it prov:Location
hasLocation	rdfs:subPropertyOf	prov:hasLocation	the PLAN. Thus it should be attributed to the system where it was designed (and also the user). The problem here is that there is a mismatch: OPMW maps the property to xsd:AanyURI and PROV considers it prov:Location. The property links an execution artifact with its value. This is normally used for parameter values. Prov:calue is intended for this very purpose as
			the PLAN. Thus it should be attributed to the system where it was designed (and also the user) The problem here is that there is a mismatch: OPMW maps the property to xsd:AanyURI and PROV considers it prov:Location The property links an execution artifact with its value. This is normally used for parameter values. Prov:calue is intended for this very purpose as well.
hasLocation	rdfs:subPropertyOf	prov:hasLocation	the PLAN. Thus it should be attributed to the system where it was designed (and also the user). The problem here is that there is a mismatch: OPMW maps the property to xsd:AanyURI and PROV considers it prov:Location. The property links an execution artifact with its value. This is normally used for parameter values. Prov:calue is intended for this very purpose as well. Original log file from which the account was built.
hasLocation hasValue	rdfs:subPropertyOf rdfs:subPropertyOf	prov:hasLocation prov:value	the PLAN. Thus it should be attributed to the system where it was designed (and also the user) The problem here is that there is a mismatch: OPMW maps the property to xsd:AanyURI and PROV considers it prov:Location The property links an execution artifact with its value. This is normally used for parameter values. Prov:calue is intended for this very purpose as well. Original log file from which the account was built. Could be considered as the original source from
hasLocation	rdfs:subPropertyOf	prov:hasLocation	the PLAN. Since the

- OPMW fits naturally into PROV
 - •Same usage-generation structure
 - •Extension for the scientific workflow with PROV
- •Binary relationships (no n-ary patterns used).
 - Simplicity
- •Publication of PROV as well as OPMW.
 - •Queries can be answered in **both** languages.
 - •Flexibility.
- •http://www.opmw.org/node/8

- Plans are not provenance
- •P-PLAN: Simple plan model for binding traces to template representations
- Aligned with OPMW and PROV
- Documentation in progress

Summary: Work done at ISI

Motif Detection Abstractions definitions and categorization **SUBDUE** exploration and Macro integration in Algorithms for automatic abstraction **RDF** matching detection Virtuoso, **Experiment Publication** Pubby, Wings (+Plugin) OPMW + PROV Plan Provenance + P-PLAN representation representation

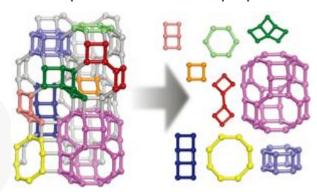

Macro abstraction detection

Problem statement:

Given a repository of workflow templates (either abstract or specific) or workflow execution traces, what are the workflow fragments I can deduce from it?

Useful for:

- •Systems like Taverna and Wings: (Many templates, little annotation to relate them)
 - •Finding relationships between workflows and sub-workflows.
 - •Most used fragments, most executed, etc.
 - •Systems like GenePattern and Galaxy: (Many runs, nearly no templates published)
 - •Proposing new templates with the popular fragments.

Macro abstraction detection

- Work in Progress (implementation and evaluation)
 - WINGS traces
- Similar to Sub-graph Isomorphism
- Kind of "Graph Clustering"
- Early results
 - •Tool for finding common sub-graphs
 - Sequential graphs
 - Efficient
 - Scalable.
 - Integration with RDF (by me)

- •Finish implementation: inference.
- •Evaluation!!

Next Steps

9GAG.COM/GAG/5677678

•Thesis:

- •Finish up implementation.
- •How to evaluate results?

•Publications:

- •Workshop:
 - •Provenance Corpus (with Taverna Team). To have something citable
- •Conference:
 - •KCAP: Macro detection implementation and evaluation.
- Journal
 - Decay analysis publication in journal (January)
 - •OPMW PROV -P-PLAN publication in journal (December)
 - Motif extension publication in journal (Invited by special issue)
 (Now)

Future work

•Thesis:

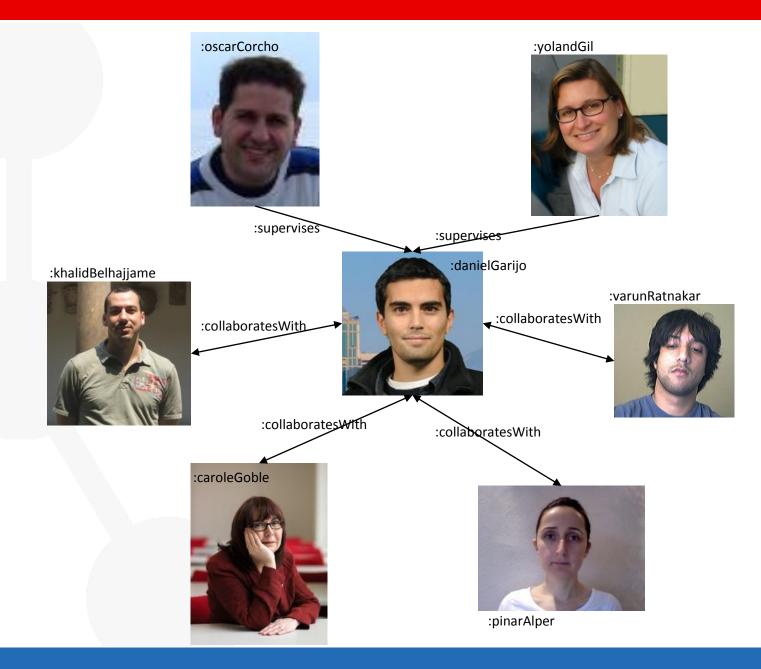

- •Other methods for detecting workflow abstraction automatically
 - •Metadata and file analysis (diff, etc.): Filter, merge, etc.
 - Provenance reconstruction.

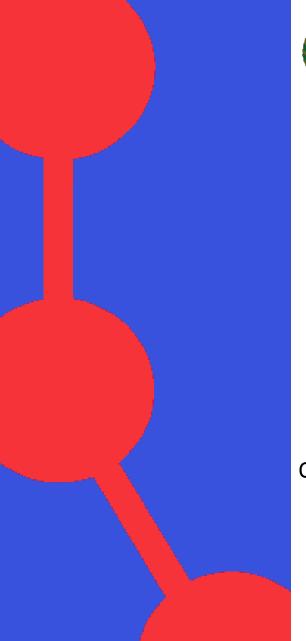

•Project:

- •RO model specifications
- Testcases
- Workflow abstraction with Isoco

Thanks!

Work at ISI, relation with wf4Ever, future steps
