Feedback from OEG Website

We should have a separate category for events, not inside the news section.

Idea to standarize every page related with OEG? Standarize, smartcities, services, mock… etc. Have the same template for deploy, ontology, services…etc.

Center on Team? Team is something that is important, so it should be alone in the menu. Inside the menu we should have a section called Who we are? Or About us?. The research group has not to be as formal as the main page of the Uni, so we can have more informal language.

Job opportunities should have more impact and have it in the menu separately.

More information in the homepage. The homepage it has to be the most relevant information about the group. Not a lot of text but more information about other parts of the website. Extend the concept of the links in other places of the website as in the homepage .

Most of the users will come from a mobile. This should have implications of the design. (Logs of the visitors? If they come from the mobile or the computer?) More simple webpages more accessible in a mobile phone.

In highlighted content of the menu must have more info about projects, opportunities , technologies, services…

If we put too much information in the webpage you could bias the kind of user that is going to use the webpage. Right now the design is flexible, in the carrousel.

Temporal frame of things. From here to 10 days this is what we have (project, job offer, collaborations…) etc.

Who are the users? Students, companies and research groups. Three categories in the homepage. Three sections one for each kind of user. In that way every kind of user will feel welcome in the webpage.

Most of people agree that this sections should be in the bottom (after highlighted content). Someone showed an example of a website that has this structure. In this case, after the main carrousel they have three sections for each profile.

Section of FAQ.

How can we present the projects for the companies?

Right now it is not possible to find a person by his/her expertise.

Archive of projects is useful for the people inside OEG, but the companies would be more interested in what can we offer you? Expertise in Linked Data or whatever. It is important to highlight in which fields we are the best. An area of "Our expertise" we don't know

Inside the project page (a single project) have the area that this project belongs to. In the people there should be also a section saying where they have their expertise. (Inside a single people layout).

Vicky asked if the projects have the links to the people that are working in that project.

How easy it will be to update this website? Minimize the text that has to be changed over time.

Instead of having just one person that updates the content, everyone could change their own information, having a user name and password that everyone could have access.

Introduce expertise in a section called "Use cases" / "Successful stories" where we can put the projects that we are working on and the results that we are having. Videos for that successful stories. Succesfull stories but very specific. Some projects that they have done they are not so proud of them, they are not so important for the group. In the other hand, there are some specific projects that they are very proud of (Smaller list of successful stories that they are really proud of). Not to put it in awards as that is more specific and more university related. Maybe in a different tab in the menu.

Publications sections are the ones that are already in the OpenAx(?), because it not is going to be used. When you want to see a publication you go to Google Scholar, but we don't use the website for that. It is important to have the list of publication for positioning purposes, but no one is going to use it.

Highlighted publications for each person of the team and then a "View all" that is a link that goes to the Archive. Each team member can choose the most relevant publications of theirselves and put it in their profile layout and then would be a link to the rest of them. For Oscar should be the

In a visual way to relate the projects with the publications and authors or workers on that project... It has to be really easy to navigate from the project layout ant the people... In that layout it should be another box called "Other Relevant resources" were we can have the GitHub repository or the API or links to other parts of the website, ontologies... etc.

Other solution could be having Tags. In that way every related projects, publications, members of the OEG that share the same tag could be visualized simply by clicking in that specific tag. This tags could be found in the project layout, the team members, the ontology... etc.

How to arrive to the Lab? It is something that it is currently in the website and they all agree that is important for people coming to the conference.

In the project layout it has to be all the information related to the project. Also the wiki the dashboard... but this ones are private so only people from the Group could access to them.

A section more informal with the fun staff that they are doing all together, informal photos, the parties that they are doing, or the football team...

Collaboration section, right now it is done by email.

Private area inside the website? Not a good idea for Oscar because it leads to a login part that it is not desirable.

Proposals section, with the CV of the members of the group and that kind of but they all agree to have it in XCloud, not in the website.
